

Distributed Acoustic Sensing (DAS)

for

Natural Hazard Assessment

Background & Motivation

- Numerous recent studies demonstrated the applicability of DAS in seismology.
- High potential in natural hazard applications where very dense coverage is desired but difficult to achieve with conventional sensors.
 - Difficult terrain.
 - Densely populated areas.
- Capability to fully exploit DAS data is lagging behind.
 - Mostly limited to conventional array processing techniques.
- The challenges of the environments where DAS is beneficial are typically ignored.
 - Rough terrain with topography.
 - Fluid-solid coupling.
 - Strong heterogeneities.

The Project

Spectral-element simulation of the Tohoku earthquake

Full-waveform modelling
and inversion

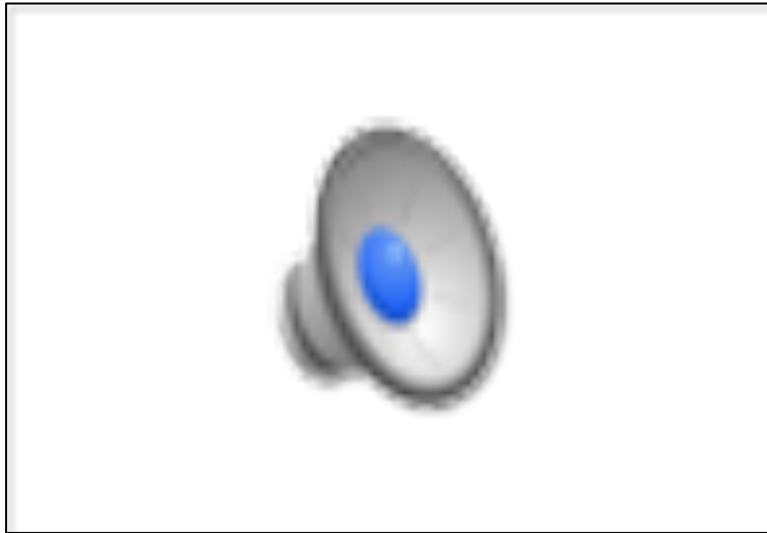

DAS cable layout on Grimsvötn volcano

DAS experiments in
challenging environments

The Project

SPINZ

Spectral-element simulation of the Tohoku earthquake

Full-waveform modelling
and inversion

DAS cable layout on Grimsvötn volcano

DAS experiments in
challenging environments
